

Model 270

SETRACERAM™ for Barometric, Gauge or Absolute Pressure

The Model 270 is Setra's highest performing analog sensor for barometric, absolute and gauge pressure measurements. Its decades worth of installations have built a reputation of reliability and remains the trusted choice for critical installations. The ceramic sensor on the 270 delivers high performance; its $\pm 0.03\%$ FS accuracy over a wide temperature range outperforms competitive transducers in the environmental sensing market. The 270 offers multiple options to fit the needs of difficult applications, making it easier to install and gather higher quality data for your project.

High Accuracy For Demanding Applications

The Model 270 pressure transducer is the most accurate analog sensor Setra manufactures. The available 0.03% FS accuracy is perfect for vital installations where precise measurements determine success or failure of the application.

Improved Performance With Ceramic Sensor

The 270 utilizes a variable capacitance sensor that is made using ceramic material fused together with glass and gold to form the SETRACERAM™ pressure element. This stable material and design offers class leading thermal performance and low hysteresis, allowing integration into demanding installations. The ceramic sensor enables improved performance compared to other stainless steel sensors, enabling the 270 to give accurate measurements and better test results.

Flexibility in Installation

The 270 offers mechanical and electrical options that can be installed into existing applications. These options reduce engineering design time, allowing for earlier project completion.

- Highest Accuracy Analog Sensor
- Captures Dynamic Pressure Changes
- Robust For Severe Weather Detection

Model 270 Features:

- High Optional Accuracy: $\pm 0.03\%$ FS
- Stable Ceramic Sensor
- Repeatability Within 0.01% FS
- Excellent Long-Term Stability: 0.1% FS/YR
- Low Power Consumption
- Instant Warm-Up
- Fast Response Time

Applications:

- High Accuracy Barometric Pressure Measurement
- Weather and Environmental Data
- Data Buoys and Remote Weather Stations
- Engine Test Cells

²Units calibrated at nominal 70°F. Max thermal error computer from this datum.

³For best performance, either negative excitation or negative output should be connected to case (ground). Both leads cannot be connected to case (ground). Units calibrated at the factory with negative excitation connected to case.

Will operate on 28 VDC aircraft power per MIL-STD-70A and not be damaged by emergency power conditions.

⁵Calibrated into a 50K ohm load, operable into a 5000 ohm load or greater.

⁶Zero output factory set to within $\pm 5\text{mV}$. Span (Full Scale) output factory set to within $\pm 5\text{mV}$.
